

Problem Solving for You and Your Cat

Introducing a Food For the First Time

A new pet food should always be introduced gradually, even if your pet appears to like the new food. This will help reduce the chance of a stomach upset following a food change.

Changes to diet affect different animals in different ways, so it is important to manage the change carefully. Some animals will be changing foods because it may be required to help manage a medical condition. For these animals it is important to follow any advice given by your veterinary surgeon.

Appetite can be affected by disease, so speak to your vet to see whether there is any special feeding advice for your pet.

You might like to try some of the following suggestions to ease the transition between foods:

- Gradually introduce the food over 5-10 days. Introduce approximately 10% of the new food each day, mixed in with the old food. Increase the proportions by 10% each day until you reach the full amount of the new food.

DAY 1-2

75% current brand
25% new pet food

DAY 3-4

50% current brand
50% new pet food

DAY 5-6

25% current brand
75% new pet food

DAY 7

100% new pet food

- If you are using canned food, warm the new food to body temperature, but no hotter. Most animals will prefer canned food slightly warm as it can improve the smell and feel in the mouth. Avoid feeding chilled foods.
- You can change the texture of canned food by adding a small amount of warm water to soften it and make it easier to mix the old and new food types together.
- Keep a bowl of clean fresh water available at all times.
- Don't be tempted to add human food tidbits to the new diet. Most animals will end up eating the human food instead and this can develop into a bad habit long term.
- For very fussy or finicky eaters, try hand feeding the new food as a treat. This will reinforce the positive bond between the owner, pet and the new food.
- No animal should be starved whilst trying to introduce a new food.
- If you are struggling to change your pet's food, speak to your veterinary surgeon or nurse to see if they have any extra behaviour tips to help you.

Ten Lives recommends the Hill's Science Diet and Hill's Prescription Diet range of food for happier and healthier cats and kittens.

Available to purchase from our Ten Lives shop: 12 Selfs Point Road, New Town, or from our Op Shops: 1717 Channel Highway, Margate & 222 Argyle Street, North Hobart.

Please contact us if you need help or information regarding any Hill's Products reception@tenlives.com.au.
